Editorial

Drinking water and electricity are basic services that proved essential to counter the impact of the COVID-19 crisis. At the same time, they represented an opportunity for investment to spur economic recovery in the countries of the region. Since the early months of 2022, they have been particularly threatened by the impact of the war in Ukraine on the world prices of fossil fuels, which are basic inputs for both sectors. Together with higher prices for edible oils, cereals and fertilizers, this has led to a rise in poverty and in energy, water and food insecurity in the region.

In Latin America and the Caribbean, large inequalities persist in access both to energy and to drinking water and sanitation, owing to a lack of high-quality supply infrastructure capable of providing water and energy security for all. Currently, in the region, 161 million people lack access to safely managed drinking water, 431 million to safely managed sanitation, 17 million to electricity and 75 million to clean cooking fuels and technologies. There is therefore both a need and an opportunity for investment to universalize coverage of these services to the entire population, which would also generate green jobs and new incomes, reduce environmental impacts and improve public health.

This bulletin analyses the current situation, the cost of short-term measures implemented during the pandemic and the opportunities for long-term investment in both sectors. It concludes that investing 2.6% of regional GDP annually over the next 10 years would suffice to universalize access to basic drinking water, sanitation and electricity services based on renewable sources, leaving no one behind. This would boost the post-pandemic recovery by generating up to 3.4 million direct green jobs per year in the water sector and 700,000 in the energy sector, enhance the resilience of cities by limiting the spread of COVID-19, other diseases or potential pandemics, reduce water and air pollution from emissions of greenhouse gases and other pollutants (thereby also promoting the energy transition to renewables) and contribute to progress towards a sustainable and inclusive water transition. These investments should be targeted at clean and sustainable technologies, contributing to the transformative recovery proposed by ECLAC, as this is part of the structural change needed in Latin America and the Caribbean if it is to make the big push for sustainability (understood as investments that are environmentally and socially beneficial).

Main article

Basic water and electricity services as key sectors for transformative recovery in Latin America and the Caribbean

1. Gaps in access to drinking water and electricity in Latin America and the Caribbean

a. Energy insecurity and its impact on people

Currently in Latin America and the Caribbean, 17 million people lack access to electricity and 75 million to clean cooking fuels and technologies, a situation that has exacerbated poverty and vulnerability during and since the pandemic and that may be exacerbated by rising fossil fuel prices in the context of the war in Ukraine. This energy insecurity is having physical, social and economic impacts on millions of people across the region (ECLAC, 2022).

The economic and social dimensions are directly related to lack of access to energy services or affordability problems, i.e., to families not having access because there is no infrastructure for it or because they cannot afford to pay for this service as they have other priorities, such as food, health care, etc.
