Foreword

In Myanmar, emphasis has been placed and a lot of inputs have been invested for improving maternal and child health services. Under the leadership and guidance of the National Health Committee, the Ministry of Health has been planning and implementing the interventions to improve the health status of mothers, newborns and children. The Ministry of Health has made efforts to reach the Millennium Development Goals, especially reducing maternal mortality and child mortality by providing quality services covering the whole country. The Ministry of Health is the major player in the health sector as a governing agency as well as a provider of comprehensive health care. However, many key players played increasing roles with evolving political and administrative circumstances. In the area of reproductive health, progress was made for maternal and newborn health and birth spacing with a reduction in maternal mortality and increase in contraceptive prevalence rate. To build on these accomplishments, health systems need to be strengthened and programmes targeted for the most vulnerable populations.

The mission of Facility Assessment for Reproductive Health Commodities and Services is to provide the information and understanding needed for the country's Reproductive Health Security. Inherent in this survey is the responsibility to collect data that accurately describe the current situation on availability of birth spacing services, life-saving reproductive health medicines, stock-out situation, logistic management system, availability of skilled staff for reproductive health care services, information & communication facilities, cold chain facilities, and clients' satisfaction. The data will be useful for country's effort to grant universal access to RH services at all level of care covering the whole country. Reliable and objective data are essential to the credibility and impartiality of reproductive health resources mobilization carried out by government and various organizations in the country. The development of an effective logistic management system is necessary to achieve equitable and timely distribution of commodities and quality RH services which is well responsive to client's need.

This report on 2015 Facility Assessment for RH Commodities and Services was prepared by the Department of Medical Research (Pyin Oo Lwin Branch) in collaboration with Maternal & Reproductive Health Division, DOPH and Department of Medical Services. The report is based on comprehensive information collected at representative sample health facilities all over the country by well-organized and trained teams during May and August 2015. This is a continuation of 2014 Assessment activities and findings also reflect comparison between two consecutive years.

We would like to thank all concerned persons without whose relentless efforts and dedication this undertaking would not have been successful. In particular, we would like to express our
