CONTENTS

THE STATE OF THE WORLD'S CHILDREN

A decade of achievement threatened

In many nations development is being derailed. Spending on health and education is being cut back. Children are paying the price. But specific actions – immunization, ORT, and birth-spacing – are now saving the lives of over 2 million children each year.

page 1

Children in debt

Falling commodity prices and rising debts have forced many nations to adopt harsh adjustment policies. But growth is not being restored. Debt-reduction and increased aid are also necessary. Renewed growth in the south would also ease the economic problems of the north.

page 15

Real aid for real development

A return to growth is not enough. A new development effort must put the poor first. Much of today's aid is distorted by both donor and recipient governments. Meeting the needs of the poor requires real aid for real development.

page 28

Real development in practice

The knowledge gained in recent decades – in maternal and child health, nutrition, food production, water supply, housing, and education – means that essential needs can be met with modest increases in resources.

page 37

Seven sins

The last decade has also yielded some important principles to guide the development effort. If observed, these could double the cost-effectiveness of that effort in the 1990s.

page 55

Today's children – tomorrow's world

The opportunity now arising to protect the mental and physical development of all young children is worthy of the attention of the world's political leaders. The financial cost of meeting all essential needs would be in the region of \$30–50 billion. With a re-allocation of existing resources plus increases in real aid, the worst aspects of poverty can be overcome by the end of this century.

page 60

Supplementary chapter:

Measuring real development

The limitations of per capita GNP, as a measure of development, have long been recognized. More direct methods of measuring human progress are needed. This additional chapter presents the case for the use of national under-five mortality rates (U5MRs) and illiteracy rates as the principal indicators of progress for children. The average annual reduction rate (AARR) is proposed as the 'speedometer' of that progress.
