Contents

Introductory address	v
Purpose of the consultation	vii
Executive summary	viii
The current strategy and its limitations	viii
Impact of preventive chemotherapy on schistosomiasis	viii
1. Preventive chemotherapy in schistosomiasis: defining objectives in different epidemiological settings – country summaries	1
1.1 China: controlling morbidity	1
1.2 Egypt: adapting the treatment strategy	3
1.3 Uganda: scaling up, and impacting on morbidity	5
1.4 West Africa: expanding control	7
1.4.1 Burkina Faso	7
1.4.2 Niger	8
2. Mapping of schistosomiasis: defining the implementation unit for preventive chemotherapy, and identifying levels of prevalence to determine the appropriate regimen	10
2.1 Mapping the distribution of schistosomiasis: historical data, risk mapping and rapid surveys	10
2.2 Validation of schistosomiasis distribution and mapping at country level	12
2.3 Considerations for targeting communities for treatment	14
2.4 Targeting schistosomiasis treatment at the sub-district level	16
3. Identifying the preventive chemotherapy strategy to achieve the objective for each implementation unit: treatment regimen, monitoring of progress, decision-making regarding future treatment	18
3.1 The evolution of preventive chemotherapy for schistosomiasis	18
3.1.1 Going beyond the health system	19
3.1.2 Adjusting the treatment strategy	20
3.1.3 Going beyond morbidity control	21
3.2 Reducing the frequency of treatment	21
3.3 Community and school-based interventions for schistosomiasis control	22
3.4 Modifying strategies during the course of schistosomiasis control programmes	23
3.5 Data requirements and reporting tools	27
3.6 Access to praziquantel for neglected tropical disease control programmes	29
4. Assessment of schistosomiasis programme impact	30
4.1 Monitoring impact in schistosomiasis control programmes	30
4.2 Impact of schistosomiasis treatment: assessment of long-term follow-up	31

5.	Integration of schistosomiasis control with other programmes for control of neglected tropical diseases	33
5.1	Planning for control: best practices	33
5.2	Resources for control: large-scale support for implementation of preventive chemotherapy	35
5.3	Schistosomiasis within the control plan for neglected tropical diseases in the WHO African Region	37
	5.3.1 Regional strategy for control of schistosomiasis, 2001–2010	37
	5.3.2 Status of schistosomiasis control in the region	37
5.4	Integrating schistosomiasis treatment into control programmes	38
5.5	Monitoring needs for control programmes: lessons from lymphatic filariasis	40
	5.5.1 Evolution of guidelines	42
5.6	Capacity building	42
6.	Points raised during the discussions	43
7.	Recommendations for refining the control strategy	48
7.1	Setting objectives and defining the problem: mapping and identifying communities at risk	48
7.2	Maintenance strategies decision after the attack phase	50
	Annex 1. Agenda	56
	Annex 2. List of participants	60

Introductory address

I warmly welcome you to Geneva and this Informal Consultation on Schistosomiasis Control. I am happy to see the room so full, and thank you for taking the time to participate.

There have been successes in schistosomiasis control, but the disease continues to be a public health problem. On 14 October 2010, WHO launched its first report on neglected tropical diseases – *Working to overcome the global impact of neglected tropical diseases* – which explains how much preventive chemotherapy has expanded. However, impediments to control include country programmes that do not always perform well; for example, that available drugs are not distributed regularly and the amount of praziquantel is limited.

The number of reported cases of schistosomiasis has been the same for the past 30 years or more, due to growth of the population and the fact that this growth is not responding to the increase in intervention. Many feel also that within the preventive chemotherapy package, schistosomiasis does not have the same political visibility as other neglected tropical diseases, whereas in fact schistosomiasis is the major tropical disease in Africa after malaria. The disease is a major public health issue associated with severe mortality and morbidity; it blocks the capacity to develop agriculture infrastructure, is linked with water development, and associated with underdevelopment and poverty.

There are successes in terms of increased funding – the United Kingdom's Department for International Development committed £25 million to fight schistosomiasis, the Global Health Initiative and the Gates-funded SCORE (Schistosomiasis Consortium for Operational Research and Evaluation)¹ initiative; and success in reducing disease prevalence was achieved in many countries (e.g. Uganda, Niger, Burkina Faso) and beyond the African continent.

Considering all the different schistosome species infecting humans, the disease has been controlled in many places, and in many cases transmission has been stopped. We should aim for a different goal: maybe we can change the way we address schistosomiasis. Perhaps we have been too conservative in the past in emphasizing only morbidity control and making policy-makers think that schistosomiasis cannot be eliminated in most endemic settings.

We are here to listen and to address schistosomiasis with policy changes you think possible.

Dr Lorenzo Savioli
Director, WHO Department of Control of Neglected Tropical Diseases, WHO

I will go into more detail of what we expect of this Consultation. In 2001, when we laid down the control strategy in our Expert Committee report, we were rather conservative in approach. The aim was morbidity control and the main target group was school-aged children. We still stand by this, but in the meantime the whole area of preventive treatment has evolved.

There have been more donations for other diseases, and this has encouraged us to be more ambitious in our approach. Schistosomiasis has followed this, and there have been requests from the field for WHO to further tailor the strategy, particularly with regard to treatment of adults. Adults were always included, but there were not many details.

So we expect recommendations about what changes are needed in the strategy. Last year there was a meeting on praziquantel treatment in preschool children, and we know what is possible and what is not possible, and our main target group remains school-aged children. But what do we need to do for our adult populations? We know praziquantel is not widely available, so we may not be able to be as generous as with other drugs for other diseases. So we must anticipate that in the first few years praziquantel will not be as widely available as other drugs against other neglected diseases. So how do we move forward? We cannot penalize populations with schistosomiasis, so we have to be generous enough to respond to the needs of those who have the disease, yet we cannot be unnecessarily generous: we cannot waste praziquantel. What is the optimal use of praziquantel within the integrated strategy of preventive chemotherapy, such that
